

ABSTRACT

The invention relates to a sanding device for a sanding machine (1), comprising a carrier (3), a sanding element (9, 10; 12) and at least two coupling elements (8, 16) with which
5 the sanding element (9, 10; 12) is coupled to the carrier (3), wherein a movable connection is provided between the sanding element (9, 10; 12) and the carrier (3), and wherein the ends of the coupling elements (8; 16) coupled to the sanding element (9, 10; 12) can move relative to each other during
10 sanding. According to another aspect, the invention relates to a sanding device for a sanding machine (1), comprising a carrier (3), a sanding element (9, 10; 12) and at least one coupling element (8, 16) with which the sanding element (9, 10; 12) is coupled to the carrier (3), wherein the coupling
15 element (16) is connected to a base (14) and wherein the base (14) is connected releasably and rotatably to the carrier (3).
